0:30-1:10

THE PROBLEM

Most surveys taste flat

They collect ratings, boxes, and free text. Then the interesting meaning disappears into a spreadsheet.

People answer in their own words.

The system asks one neutral follow-up.

The participant confirms the summary before it counts.

Start with a normal-looking survey. Then make it deeper.

1:10-1:55

PARTICIPANT FLOW

One question, then one better question

The participant is not forced into a category first. They write naturally, and DeepAsk asks for the missing detail.

No persuasion. No scoring. No judgement.

The AI only clarifies meaning, barriers, needs, and suggestions.

The ice cream theme keeps the demo light enough to understand fast.

The screenshot displays a web interface for a survey titled "Ice Cream Survey". At the top left, it says "PARADOXS DeepAsk Live". At the top right, there are buttons for "Survey" and "About". Below the title, there is a subtitle "QUICK TASTE TEST" and a paragraph of instructions: "Answer one question at a time. DeepAsk may ask a neutral follow-up, then turns the answers into a small group map about ice cream preferences." Below the instructions, there are three tabs: "3 questions", "Neutral follow-ups", and "Mind Hive after submit". At the bottom of this section, there are two buttons: "Simple survey" and "Research mode". Below this is a section for "QUESTION 1". It has two tabs: "SHOWING: ORGANISER QUESTION" and "WRITING: YOUR FEEDBACK". The main text of the question is "What makes an ice cream really good for you?". Below the question, there is a section labeled "Your feedback" with a text input field that says "Write your answer here..."

The fun wrapper makes the mechanism easy to explain.

1:55-2:45

THE GOVERNANCE LAYER

Original voice stays separate

The important part is not just the UI. It is the workpack behind every answer.

Raw participant text is stored separately from AI interpretation.

The summary is shown back to the participant.

The organiser can audit what happened without exposing raw answers publicly.

The screenshot displays the 'PARADOGS - SURVEY BUILDER' interface, specifically the 'Organiser workspace'. At the top, there are navigation buttons: 'Organiser', 'About', 'Open participant survey', and 'Lock'. Below this, the main heading 'Organiser workspace' is followed by a descriptive text: 'Build the civic question flow, keep participant answers separate, and inspect the operational signals behind the Mind Hive group map.' A secondary navigation bar includes 'Builder' (highlighted), 'Results', 'Mind Hive', 'Audit', and 'Share'. The main content area is titled 'CONFIGURE Survey builder' and features a 'New survey' button. It contains several input fields: 'Survey' (set to 'DeepAsk Live'), 'Survey ID' (set to 'hackathon-comet-2026'), 'Title' (set to 'DeepAsk Live'), and 'Public subtitle' (set to 'Paradogs - Yes, but no'). A 'Participant intro' section at the bottom describes the survey flow. On the right side, a 'Boundary' section explains the survey flow and the collective nature of the data.

Paradogs - Yes, but no

Participant intro
Answer one question at a time. DeepAsk may ask a short neutral follow-up, then turns the submitted answers into a shared group map.

Boundary

Participants stay in a clean survey flow. Organisers configure questions, review aggregate patterns, and inspect operational data here.

Mind Hive stays collective: it shows group patterns and statement reactions, not public pages for individual people.

The organiser side is where the audit trail lives.

2:45-3:40

MIND HIVE

From answers to group signals

DeepAsk does not publish individual result pages. It turns completed workpacks into collective patterns.

Agreements, tensions, minority concerns, and next questions.

People react to group statements, not to other people.

The goal is not a final verdict. It is a better next conversation.

The group layer opens only when there is enough signal.

3:40-4:35

OPERATOR SURFACE

A small tool, not a magic box

The organiser can create surveys, review summaries, export data, and inspect the researcher record.

Survey builder for the question flow.

Results and audit tabs for the operational record.

JSON and CSV export when the data needs to leave the demo.

The screenshot shows the 'PARADOGS Organiser workspace' interface. At the top, there are links for 'Organiser' and 'About'. The main heading is 'Organiser workspace' with a subtext: 'Build the civic question flow, keep participant answers separate, and inspect the operational signals behind the Mind Hive group map.' Below this, there's a 'PRIVATE ORGANISER AREA' section with the heading 'Enter organiser code'. A text box explains: 'Participant surveys stay public. This workspace controls questions, raw response audit, and operational settings.' There's a field for 'Organiser code' with a placeholder 'Enter code' and a button 'Unlock organiser'. To the right, a 'Boundary' section contains two notes: 'No user system. Just a shared organiser code for the hackathon demo.' and 'Live deployments should set ORGANIZER_CODE in the server environment.'

Public participants outside. Protected operator controls inside.

4:35-5:00

CLOSING

Better listening, one scoop deeper

DeepAsk is not trying to replace human judgement. It helps people say what they mean, and helps organisers see what the group is really saying.
